Isotropy theorem (arbitrary spin)

Isotropy Theorem: The average Energy-Momentum tensor of a field of any spin minimally coupled to gravity is diagonal and isotropic if

- 1.- the field evolves rapidly with respect to the background metric evolution.
- 2.- ϕ^a_i and $\dot{\phi}^a_i$ are bounded.

Power-law theories:

$$\mathcal{H} = (\lambda^{AB} g_{00} \Pi_A^0 \Pi_B^0)^{n_T} + (M_{AB} \dot{\phi}^A \dot{\phi}^B)^{n_V}$$

Average equation of state:

$$\omega = \frac{2 n_V}{1 + \frac{n_V}{n_T}} - 1$$

Repulsive Self-interactions

- Generic interaction: derivative and non-derivative terms.
- Low energy regime: nonrelativistic limit; conservation of matter + Euler equation
- Negligible quantum pressure on cosmological and galactic scales
- Self-interaction generate a significant repulsive pressure.
- The hydrostatic equilibrium obtained by balancing the gravitational and scalar interactions imply that virialized structures have a solitonic core of finite size depending on the speed of sound of the dark matter fluid.

P. Brax, JARC, and P. Valageas, Phys. Rev. D 100, 023526 (2019) 2

Perturbations

CDM	$\Psi = \Phi = \text{const.}$ $\dot{\phi} = a^2$ $Q = a^2$	$\Psi = \Phi = \text{const.}$ $\dot{\phi} = a^2$ $Q = a^2$
Scalar	$\Psi = \Phi = \text{const.}$ $\dot{\phi} = a^2$ $\dot{\phi} = \text{const.}$	Particle Regime $\Psi = \Phi = \text{const.}$ $\dot{\phi} = a^2$ $\dot{\phi} = a^2$
Vector	Averaging fails $\Psi = \Phi = \text{const.}$ $\dot{\phi} = a^2$ $Q = a^2$ $h_i = 0$	Wave Regime $\Psi = \Phi = a^2$ $\dot{\phi} = a^2$ $\dot{\phi} = a^2$
k^2	$\frac{1}{\lambda_{DB}^2}$	$\frac{1}{\lambda_{DB}^2}$

JARC, A.L.Maroto, Núñez Jareño, JHEP 1702 (2017) 064

De Broglie wavelength:
Localization in a sphere with radius:

$$\lambda_{DB} = \frac{1}{mv} = \frac{1}{mHr}$$

$$r \geq \lambda_{DB}$$

$$r \geq \frac{1}{\sqrt{Hm}}$$

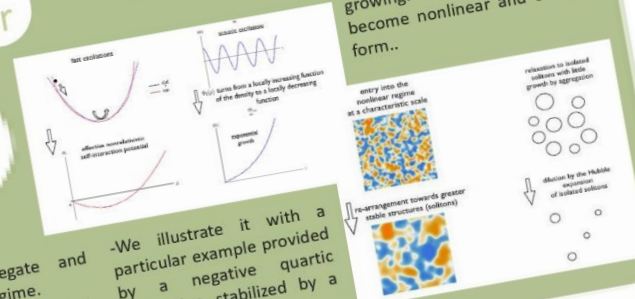

Compact clusters as Dark Matter

The clumps aggregate and reach a universal regime.
-They play the role of cold dark matter.

-We illustrate it with a particular example provided by a negative quartic interaction stabilized by a positive sixth term.

P. Brax, JARC, and P. Valageas, Phys. Rev. D 102, 083012 (2020) 8

-When the squared speed of sound of the scalar fluid becomes negative, an instability arises and the fluctuations of the scalar energy-density field start growing. They eventually become nonlinear and clumps form..
