

## **Supax - A new superconducting axion search experiment @ Mainz**

*Monday 8 August 2022 12:10 (20 minutes)*

Axions, the famous hypothetical particle that explains the absence of CP violation in QCD is also an exciting candidate for dark matter.

At Mainz we're currently constructing a new experiment utilizing superconducting RF cavities in a 14T magnetic field to search for axions in the 8.4 GHz range. In this talk the physics reach of the experiment will be discussed as well as the status and first test-results of our prototype cavity.
