

The Proton Radius and its Relatives A.D. 2023

Ulf-G. Meißner, Univ. Bonn & FZ Jülich

Contents

- Introductory remarks
- Theoretical framework: Dispersion relations
- Discussion of the spectral functions
- Fit procedure & theoretical uncertainties
- Results for space- and time-like ffs
- The proton radius and its relatives
- The proton radius from J/ψ decays
- Summary and outlook

Introductory remarks

Facets of the nucleon

- Nucleons (neutrons, protons) are the building blocks of the matter surrounding us
- Various probes (electromagnetic, weak, ...) see different facets/scales

Fig. from Pohl et al., Nature 466 (2010) 213

Fig. from Bernard, Elouadrhiri, UGM, J.Phys.G 28 (2002) R1

Proton radius puzzle

Article Talk

Main page Contents Current events Random article About Wikipedia Contact us The **proton radius puzzle** is an unanswered problem in physics relating to the size of the proton.^[1] Historically the proton charge radius was measured by two independent methods, which converged to a value of about 0.877 femtometres (1 fm = 10^{-15} m). This value was challenged by a 2010 experiment using a third method, which produced a radius about 4% smaller than this, at 0.842 femtometres.^[2] New experimental results reported in the autumn of 2019 agree with the smaller measurement, as does a re-analysis of older data published in 2022. While some believe that this difference has been resolved,^[3] this opinion is not yet universally held.^{[4][5]}

• Or stated differently: It's all about precision

The proton radius: from a puzzle to precision

Hans-Werner Hammer^{a,b}, Ulf-G. Meißner^{c,d,e,*}

Theoretical framework

Review: Lin, Hammer, UGM, Eur. Phys. J. A 57 (2021) 255

Basic definitions

• Nucleon matrix elements of the electromagnetic vector current $J_{\mu}=ar{q}\mathcal{Q}\gamma_{\mu}q$

$$\langle N(p')|m{J_\mu}|N(p)
angle = ar{u}(p')\left[m{F_1(t)}\,\gamma_\mu + i\,rac{F_2(t)}{2m}\,\sigma_{\mu
u}q^
u\,
ight]u(p)$$

- $\star \, q = (u,d)^{ ext{T}}$, $\mathcal{Q} = e \operatorname{diag}(2/3,-1/3)$
- $\star F_1$ = Dirac form factor, F_2 = Pauli form factor
- \star four-momentum transfer $t\equiv q^2=(p'-p)^2\equiv -Q^2$
- \star isospin basis $F_i^S = (F_i^p + F_i^n)/2 \ , \ \ F_i^V = (F_i^p F_i^n)/2$
- * Normalizations: $F_1^V(0) = F_1^S(0) = 1/2, F_2^{S,V}(0) = (\kappa_p \pm \kappa_n)/2$
- \star Sachs form factors: $G_E = F_1 + rac{t}{4m^2}F_2 \;,\; G_M = F_1 + F_2$
- \star Nucleon radii: $F(t) = F(0) \; \left[1 + t \langle r^2
 angle / 6 + \ldots
 ight]$ [except for the neutron charge ff]

\hookrightarrow analyze in a model-independent approach: Dispersion Relations

Dispersion relations

Federbush, Goldberger, Treiman, Drell, Zachariasen, Frazer, Fulco, Höhler, ...

- The form factors have cuts in the interval $[t_n, \infty[$ (n = 0, 1, 2, ...) and also poles
- \Rightarrow Dispersion relations for $F_i(t)$ (i = 1, 2):

$$F_i(t) = rac{1}{\pi} {\int_{t_0}^\infty} dt' \; rac{{
m Im}\; F_i(t')}{t'-t} \; ert$$

- no subtractions
 [only proven in perturbation theory]
- suppression of higher mass states
- central objects: spectral functions

 $\operatorname{Im} F_i(t)$

 $- \operatorname{cuts} \stackrel{\wedge}{=} \operatorname{multi-meson} \operatorname{continua}$ $- \operatorname{poles} \stackrel{\wedge}{=} \operatorname{vector} \operatorname{mesons}$

sometimes intertwined!

Isovector spectral function

• exact 2π continuum is known from threshold $t_0 = 4M_\pi^2$ to $t \simeq 40\,M_\pi^2$

Im
$$G_{E,M}^{V}(t) = \frac{q_{t}^{3}}{\sqrt{t}} F_{\pi}(t)^{\star} f_{\pm}^{1}(t)$$

 $\star F_{\pi}(t)$ = pion vector form factor

* $f_{\pm}^{1}(t)$ = P-wave pion-nucleon partial waves in the t-channel

ullet Spectral functions inherit singularity on the second Riemann sheet in $\pi N
ightarrow \pi N$

 $t_c = 4 M_\pi^2 - M_\pi^4/m^2 \simeq 3.98\,M_\pi^2 \Big|
ightarrow {
m strong shoulder}
ightarrow {
m isovector radii}$

• For a recent determination of the 2π continuum, see HKRHM, EPJA 52 (2016) 331

 \hookrightarrow based on a precise RS-equation analysis Hoferichter, de Elvira, Kubis, UGM, Phys. Rept. 625 (2016) 1

• Higher mass states represented by poles (not necessarily physical masses)

Frazer, Fulco, Höhler, Pietarinen, ...

Isoscalar spectral function

- $K\bar{K}$ continuum can be extracted from analytically cont. KN scattering amplitudes
 - \rightarrow analytic continuation must be stabilized
 - ightarrow generates most of the ϕ contribution

Hammer, Ramsey-Musolf, Phys. Rev. C 60 (1999) 045204, 045205

- Further strength in the ϕ -region generated by correlated $\pi \rho$ exchange
 - ightarrow strong cancellations ($Kar{K}, K^*K, \pi
 ho$)
 - ightarrow takes away sizeable strength from the ϕ

UGM, Mull, Speth, van Orden, Phys. Lett. B 408 (1997) 381

• Spectral functions exhibit anomalous threshold (analyzed in 2-loop CHPT)

$$\left|t_c = M_\pi^2 \left(\sqrt{4-M_\pi^2/m^2} + \sqrt{1-M_\pi^2/m^2}
ight)^2 \simeq 8.9\,M_\pi^2
ight|
ightarrow$$
 effectively masked

Bernard, Kaiser, M, Nucl. Phys. A 611 (1996) 429

• Higher mass states represented by poles (with a finite width)

Constraints on the spectral functions

- Normalizations: electric charges, magnetic moments
- Radii not imposed [except for the neutron charge radius]

• Superconvergence relations \cong leading pQCD behaviour

Filin et al., Phys. Rev. C 103 (2021) 024313

 $\langle r_n^2 \rangle = -0.105^{+0.005}_{-0.006} \,\mathrm{fm}^2$

$$F_1(t) \sim 1/t^2 \;, F_2(t) \sim 1/t^3 \; (ext{helicity} - ext{flip})$$
 Brodsky et al.

$$\Rightarrow \int_{t_0}^{\infty} \operatorname{Im} F_1(t) \, dt = 0 \,, \quad \int_{t_0}^{\infty} \operatorname{Im} F_2(t) \, dt = \int_{t_0}^{\infty} \operatorname{Im} F_2(t) \, t \, dt = 0$$

 \Rightarrow severely restricts the number of fit parameters

Form factors in the time-like region

• Xsection for $e^+e^- \leftrightarrow ar{p}p, ar{n}n$ in the one-photon approximation

- $G_{E,M}(s)$ are complex for $s \geq 4m_N^2$
- Threshold constraint: $G_E(4m_N^2) = G_M(4m_N^2)$
- Gamov-Sommerfeld factor (only for the proton):

$$C = rac{y}{1-e^{-y}}\,, \;\; y = rac{\pi lpha_{
m EM} m_p}{k_p}\,, \;\; \sqrt{s} = 2 \sqrt{m_p^2 + k_p^2}$$

• Data from $e^+e^- \rightarrow \bar{N}N$ & $\bar{N}N \rightarrow e^+e^-$: strong threshold enhancement & oscillations

 $rac{k_p}{k_e}$

Summary: spectral functions

• Cartoons of the isoscalar/isovector spectral functions:

Fit procedure & theoretical uncertainties

Review: Lin, Hammer, UGM, Eur. Phys. J. A 57 (2021) 255

Data basis

• Data basis:

Region	Observables	Source	$ t \ { m GeV}^2$	number	
	$d\sigma/d\Omega$	MAMI	0.00384-0.977	1422	
	<i>ao</i> / <i>a</i> sz	PRad	0.000215-0.058	number 1422 71 16 4 29 49 153 32 6 10

	$ \overline{G^p_E/G^p_M} $	BaBar	3.52-9.0	6	
	$d\sigma/d\Omega$	BESIII	3.52-3.80	10	

• Number of data/fit parameters:

$$\#_{\text{data}} = 1792 , \quad \#_{\text{fitpara.}} = \underbrace{4}_{\omega+\phi} + 3 \underbrace{(N_s + N_v)}_{best \ fit: \ 3+5} + 4 \underbrace{(N_S + N_V)}_{best \ fit: \ 3+3} - 11 + \underbrace{31+2}_{\text{norm.}}$$

Fit procedure & uncertainty quantification

• Fit strategy (weighted average): $\chi^2_{\text{total}} = \sum_{i \text{ in data basis}} \frac{\chi^2_i}{\# \text{ data points}}$

 \hookrightarrow use covariance matrix whenever available

- Systematic and statistical uncertainties, only recently fully incorporated
- Systematics: Vary the number of poles around the best solution so that $\delta \chi^2_{
 m total} \leq 1\%$ Höhler et al. (1976)
- Statistical errors, use
 - bootstrap method
 - Bayesian analysis

Efron, Tibshirani (1986)

Bayes (1763)

 \Rightarrow both give the same result, bootstrap simpler to implement

Results

Lin, Hammer, UGM, Phys. Rev. Lett. 128 (2022) 5, 052002

Space-like results I

• ep scattering data and neutron ffs: [error bands from bootstrap, χ^2 /dof=1.223]

- Ulf-G. Meißner, The Proton Radius and its Relatives A.D. 2023 - plenary talk, EFB25, Mainz, July 31 stunzip figs-j, 2023 -

Space-like results II

• Proton form factor ratio [Jlab data]:

- zero crossing disfavored

Time-like results I

• Proton effective form factor:

open symbols not fitted

 $|G^p_{
m eff}|_{
m smooth}=rac{7.7}{(1+t/14.8)(1-t/0.71)^2}$ BaBar fit formula: $F_p=A^{
m osc}\exp(-B^{
m osc}p)$

 $\times \cos(C^{\mathrm{osc}}p + D^{\mathrm{osc}})$

Time-like results II

• Neutron effective form factor:

open symbols not fitted

$$\begin{split} |G_{\text{eff}}^{n}|_{\text{smooth}} &= \frac{4.87}{(1+t/14.8)(1-t/0.71)^2} \\ \text{BESIII fit formula:} \\ F_{p} &= A^{\text{osc}} \exp(-B^{\text{osc}}p) \\ &\times \cos(C^{\text{osc}}p + D^{\text{osc}}) \end{split}$$

Time-like results III

• More fits and predictions [pQCD & phases]

The proton radius and its relatives

Fig. courtesy Yong-Hui Lin

Proton charge radius

• Definition:

 $\left(r_p^2\equiv-6\,G_E^\prime(0)
ight)$

[not discussing charge distribution here!]

• Measurements:

- Leptonic hydrogen Lamb shift (LS) [in principle 2 numbers: $r_p \& R_\infty$]

$$\Delta E_{LS} = \Delta E_1 + \Delta E_2 C(r_p^2) + \mathcal{O}(m_{\rm red}\alpha_{\rm EM}^2)$$

$$C(r_p^2) = c_1 + c_2 r_p^2 + \mathcal{O}(m_{\rm red} \alpha_{\rm EM}^2)$$

- Lepton-proton scattering (Rosenbluth separation)

$$rac{d\sigma}{d\Omega} = rac{d\sigma_{
m Mott}}{d\Omega} rac{1}{1+ au} \left(m{G}_E^2 + rac{ au}{arepsilon} m{G}_M^2
ight) (1+\delta_{
m rad.}) + \mathcal{O}(m_{
m red}lpha_{
m EM}^2)$$

• The neglected sibling, the proton magnetic radius:

$$(r_p^M)^2 \equiv -(6/\mu_p) \, G'_M(0)$$

Proton charge & magnetic radius

Lin, Hammer, UGM, Phys. Lett. B **816** (2021) 136254 [2102.11642 [hep-ph]] Phys. Rev. Lett. **128** (2022) 052002 [2109.12961 [hep-ph]]

• Our determination incl. statistical and systematic errors:

 $r_E^p = 0.840^{+0.003}_{-0.002}_{-0.002} \text{ fm} \ , \ \ r_M^p = 0.849^{+0.003}_{-0.003}_{-0.004} \text{ fm}$

• Comparison to earlier DR determinations (and some data)

• Comparison to recent measurements:

Neutron radii

• The charge squared neutron $(r_E^n)^2$ radius was mostly input in DR analyses, but not the magnetic one

 $r_M^n = 0.864^{+0.004}_{-0.004} + 0.006_{-0.001} \, {
m fm}^2$

Lin et al., full data, 2021 \hookrightarrow rather stable over time Lin et al., space-like data, 2021 \hookrightarrow but larger variation I. T. Lorenz et al. 2012 M. A. A closer look at the hyperfine splitting

Antognini, Hagelstein, Pascalutsa, Ann.Rev.Nucl.Part.Sci. 72 (2022) 389

- Hyperfine splitting in electronic and muonic hydrogen sensitive to:
 - \star the Zemach correction Δ_Z

$$\Delta_Z = -2Zlpha m_r \, r_{
m Z} \,, \quad r_{
m Z} = -rac{4}{\pi} \int_0^\infty rac{{
m d}Q}{Q^2} \left[rac{G_E(Q^2)G_M(Q^2)}{1+\kappa} - 1
ight]$$

 \star the recoil correction Δ_R

$$\begin{split} \Delta_R &= \frac{Z\alpha}{\pi(1+\kappa_p)} \int_0^\infty \frac{\mathrm{d}Q}{Q} \Biggl\{ \frac{G_M(Q^2)}{Q^2} \frac{8m_\mu M_p}{v_l + v} \left(2F_1(Q^2) + \frac{F_1(Q^2) + 3F_2(Q^2)}{(v_l + 1)(v + 1)} \right) \\ &- \frac{8m_r G_M(Q^2) G_E(Q^2)}{Q} - \frac{m_\mu F_2^2(Q^2)}{M} \frac{5 + 4v_l}{(1+v_l)^2} \Biggr\} \\ &v = \sqrt{1 + 4M_p^2/Q^2} , \quad v_l = \sqrt{1 + 4m_\mu^2/Q^2} \end{split}$$

Zemach radius & recoil correction

• Our determination of r_Z incl. statistical and systematic errors:

Antognini, Lin, UGM. Phys. Lett. B 835 (2022) 137575 [2208.04025 [nucl-th]]

• and the results for Δ_R (slightly improved compard to Tomalak 2017)

$$\Delta_R^{\mu p} = (837.6^{+1.7+2.2}_{-1.0-0.1}) \times 10^{-6} = (837.6^{+2.8}_{-1.0}) \times 10^{-6}$$
$$\Delta_R^{H} = (526.9^{+1.1+1.3}_{-0.3-0.2}) \times 10^{-8} = (526.9^{+1.7}_{-0.4}) \times 10^{-8}$$

The proton charge radius from J/ψ decays III

Lin, Guo, UGM, in preparation

• Results: Delta contribution and sensitivity to r_p

\rightarrow determination of the possible accuracy of the r_p extraction in the works

Summary & outlook

- Dispersion theory is the best tool to analyze the nucleon em FFs
- Description of all data, time- and space-like
- Always a small proton charge radius (0.84 fm), magnetic one bigger (0.85 fm)
- · Most recent experiments tend to the small radius
- From a "puzzle" to precision Hammer, UGM, Sci.Bull. 65 (2020) 257
- Predictions for PRad-II & positron-proton scattering (also MESA/Mainz)
- Magnetic radius of the neutron is the largest one
- Theory challenge I: Get the neutron ffs from fits to few-nucleon systems
- Theory challenge II: better understanding of the oscillations in $|G^{p,n}_{
 m eff}|$
- Experimental challenges
 - \hookrightarrow proton form factor ratio at $Q^2 \simeq 10 \, {
 m GeV^2}$
 - \hookrightarrow more resolved form factor measurements in the time-like region
 - $\hookrightarrow \mu p$ scattering testing lepton flavor universality (MUSE, AMBER)

The last words from the press

• The story of the proton radius has left some aftertaste

The measurements of the proton size is a story of trials and tribulations

Physicists strive to describe nature in an unbiased way. However, the back and forth about the radius of the proton shows that they do not always live up to this claim.

Best fit incl. time-like data

Lin, Hammer UGM, Phys. Rev. Lett. 128 (2022) 052002 [2109.12961 [hep-ph]]

BAYESIAN ANALYSIS

• Bayes theorem: $P(\text{parameters}|\text{data}) = \frac{P(\text{parameters})P(\text{data}|\text{parameters})}{P(\text{data})}$

posterior \sim prior \times likelihood

 Bayesian analysis of the PRad data (71 data pts)

BAYESIAN versus BOOTSTRAP

• Bootstrap sampling in comparison to the Bayesian analysis [PRad data]

Method	r_{E}^{p} [fm]	r^p_M [fm]
Bayes normal	0.828 ± 0.011	0.843 ± 0.004
Bayes uniform	0.828 ± 0.011	0.843 ± 0.004
Bootstrap	0.828 ± 0.012	0.843 ± 0.005

 \hookrightarrow identical results, but bootstrap much faster

 \hookrightarrow will use the bootstrap method to determine the statistical error

• Energy levels in hydrogen:

$$\left(E_{n\ell j} = \mathbf{R}_{\infty} \left(-\frac{1}{n^2} + f_{n\ell j}\left(\alpha, \frac{m_e}{m_p}, \ldots\right) + \delta_{\ell 0} \frac{C_{\rm NS}}{n^3} r_p^2\right)\right)$$

$$f_{n\ell j}\left(\alpha, \frac{m_e}{m_p}, \ldots\right) = X_{20}\alpha^2 + X_{30}\alpha^3 + X_{31}\alpha^3 \ln \alpha + X_{40}\alpha^4 + \ldots$$

- $-n,\ell,j$ principal, orbital, total ang. momentum quantum numbers
- $-f_{n\ell j}$ relativistic corr's, vacuum effects, other QED corrections
- $-\,m_e/m_p$ enters through the coefficients $X_{20},\,X_{30},\,...$ (recoil)
- $C_{
 m NS}$ calculable leading order correction due to the finite r_p
- higher order charge distributions are included in $f_{n\ell j}$
- \Rightarrow must measure at least 2 transitions to pin down the two unknowns \Rightarrow this is done in recent measurements, but not before! [inconsistency]

• Relevant formulas:

 $\Delta E_{LS} = 206.0336(15) - 5.2275(10) \langle r_p^2 \rangle + 0.0347 \langle r^3 \rangle_{(2)}$

 $\Delta E_{HFS} = 22.9843(30) - 0.1621(10) r_Z$

LA TAILLE DU PROTON NE FAIT PLUS DÉBAT

0.84 femtomètre (fm), soit 0.0000000000084 mm; c'est ce que mesure le rayon d'un proton! La taille de cette particule était sujette à un vif débat depuis les années 2010, que nous vous racontions en décembre 2019 (S&V n°1227, p. 26). Jusqu'en 2010, le rayon officiel du proton était de 0.88 fm. Mais cette année-là, une mesure indirecte basée sur l'interaction de muons avec des électrons avait semé le doute: elle l'estimait à 0.84 fm seulement, soit une différence de tout de même 5 % ! Pour en avoir le cœur net, une autre équipe internationale avait alors lancé une expérience et, huit ans après, elle enfonçait le clou: oui, le proton semble mesurer 0,84 fm seulement. Aujourd'hui, "le doute n'est plus permis, cette valeur basse est la seule correcte", tranche Ulf Meissner. Avec son équipe de l'université de Bonn, le chercheur a analysé les données de toutes les expériences de physique des particules effectuées dans le monde consistant à bombarder des électrons sur des protons. ou de les faire s'annihiler avec des positrons pour former des protons, comme BaBar ou BESIII. De quoi permettre aux physiciens de remonter par de savants calculs au rayon du proton : 0,84 fm. "Le débat est clos, conclut Ulf Meissner. Il ne s'agit plus de discuter si la valeur correcte est la valeur haute ou la basse, mais d'augmenter la précision sur cette dernière. Ce à quoi nous allons désormais nous consacrer." Benoît Rev

Die Vermessung des Protons ist eine Geschichte der Irrungen und Wirrungen

Physiker sind bestrebt, die Natur unvoreingenommen zu beschreiben. Das Hin und Her um den Radius des Protons zeigt jedoch, dass sie diesem Anspruch nicht immer gerecht werden. VON CHRISTIAN SPEICHER

ATOMIC AND MOLECULAR | FEATURE Solving the proton puzzle

19 Jun 2021

Taken from the June 2021 issue of *Physics World*. Members of the Institute of Physics can enjoy the full issue via the *Physics World* app.

Why were so many physicists so wrong about the size of the proton for so long? As Edwin Cartlidge explains, the solution to this "proton radius puzzle" has as much to do with bureaucracy and politics as it does with physics
