

# Status of P2

S. Baunack

2024/09/18, Mainz Meeting

# Outline

- Spectrometer detector
- Superconducting coil
- Scattering chamber
- Detector readout
- Luminosity monitors
- Computing
- Refrigerator
- Tracker

# P2 experiment: Setup

# Spectrometer: Fused silica bars

- Manufacturer: Heraeus Quarzglas GmbH
- Material: Spectrosil 2000
- Award of contract: 10/2020
- 100% delivered (90 pieces), most recent delivery 03/2022
- Measurement of the dimensions finished

# Spectrometer: Fused silica bars

Specified dimensions:

Platte, SPECTROSIL 2000, allseitig poliert

Length: 650,00 mm  $\pm$  0,50 mm

Width: 67,60 mm  $\pm$  0,50 mm

Thickness: 10,00 mm  $\pm$  0,20 mm

Thickness of quartz bar #40

Typical example

# Spectrometer: Fused silica bars

Specified dimensions:

Platte, SPECTROSIL 2000, allseitig poliert

Length: 650,00 mm  $\pm$  0,50 mm

Width: 67,60 mm  $\pm$  0,50 mm

Thickness: 10,00 mm  $\pm$  0,20 mm

Thickness of quartz bar #54

Not so typical example

# Spectrometer: Photomultiplier

- Manufacturer: ET Enterprises
- Model: 9305QKB
- Award of contract: 11/2021
- 100% delivered (300 pieces), latest delivery 04/2023
- Testing and characterization almost completed (~90%)

# High voltage supply

- Manufacturer: CAEN
- A 7030N modules
- Output voltage max. 3.5 kV
- 144 channels in total
- Order 06/2021, Delivery 03/2022

# Spectrometer: Detector support

# Spectrometer: Detector support

- Final design
- Can be 3D printed (Peek)
- Four test copies are currently being ordered
- 72 copies ~ 20 k€

# Lead shielding

- Ordering in process

- Manufacturer: Röhr+Stolberg
- Delivered February 2024
- Approximately 9 tons

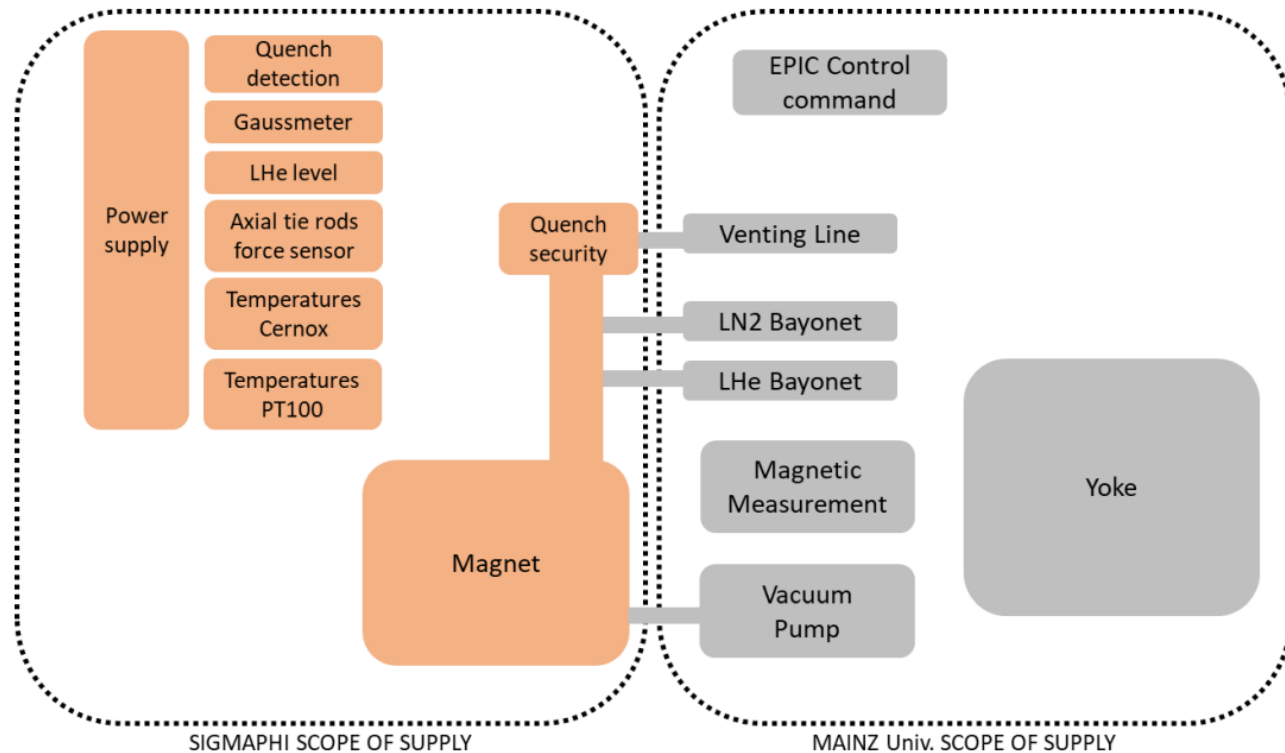

# Superconducting coil

Contact and discussion with Sigmaphi Magnets since 2017

Award of contract: May 2020

Design parameter:

- Inner diameter: 2.4 m
- Effective length: 3.4 m
- Operating current: 640 A
- Magnetic field: 0.7 T
- LHe vaporisation : 12.8 l/h
- LN2 vaporisation: 5.0 l/h

# Superconducting coil

- Challenging project and Corona pandemics
- Several postponements of the delivery date

Delivery date:

- December 2021
- December 2022
- May 2023
- November 2023
- March 2024
- September 17, 2024
- **October 31, 2024**

Photo: Sigmaphi

# Superconducting coil

- Preparations for bringing the solenoid into the experimental hall
- Institute's workshop takes care

# Superconducting coil

# Scattering chamber

- Tender in July 2023 was successful
- Manufacturer: NTG (Gelnhausen)
- Delivery November 2024

# Scattering chamber

- Up-to-date CAD drawing from NTG

# Vacuum system

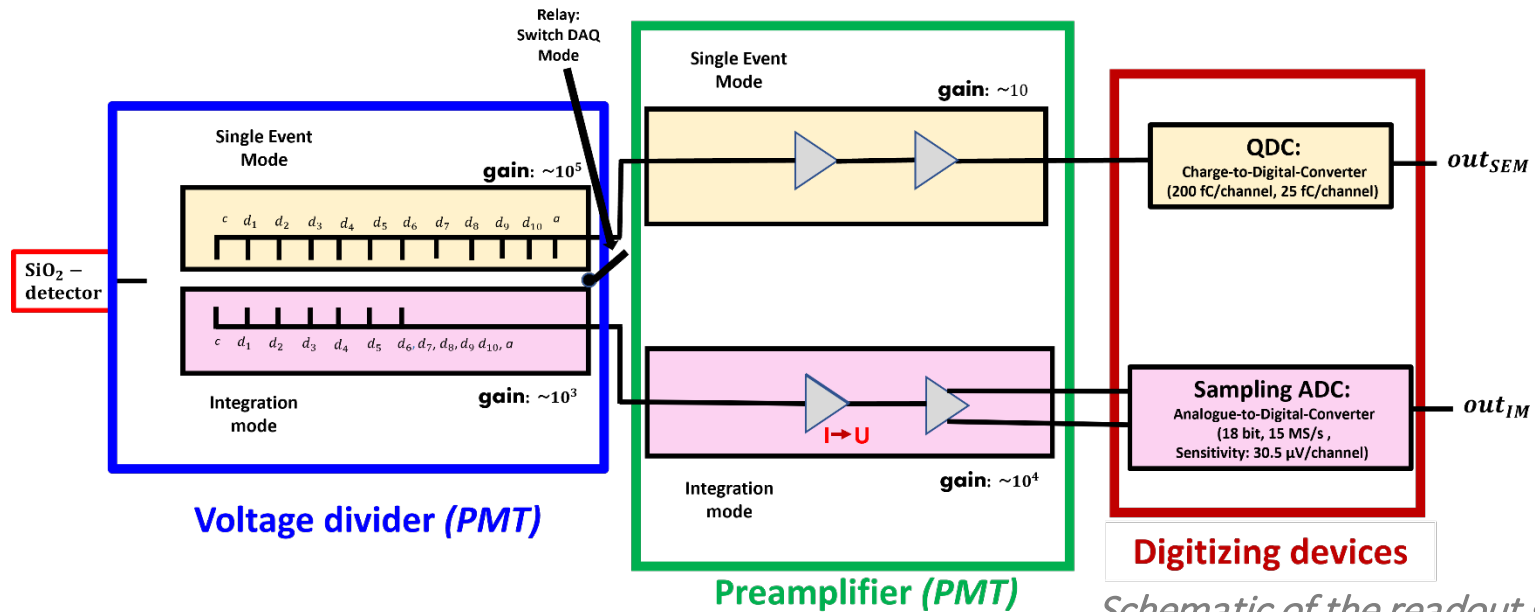

Delivered January 2024:

- 3 turbomolecular pumps  
(*HiPace 700 H from Pfeiffer Vacuum*)
- 3 scroll pumps  
(*HiScroll 18 DN from Pfeiffer Vacuum*)
- *Additional equipment*

# Detector readout

*Schematic of the readout signal path for the Fused Silica Cherenkov Detector*

## P2 DivA board

- 10 dynodes of the PMT in **SEM**
- 5 dynodes of the PMT in **IM**
- Fixed test current at the input of preamplifier

## SEM: QDC basic parameters

- QDC CAEN V965
- 12 bit resolution
- 25 fC LSB and 200 LSB

## IM: Sampling ADC basic parameters

- FPGA based; Dynamic range of  $\pm 4.096 \text{ V}$
- 18-bit resolution,  
(Sensitivity:  $\frac{8\text{V}}{2^{18}} = 30,5 \mu\text{V}$ )
- 15 MSps

# Detector readout

*Setup for detector and electronics tests at MAMI*

*P2 detector pulses on oscilloscope*

*Sampling ADC board*

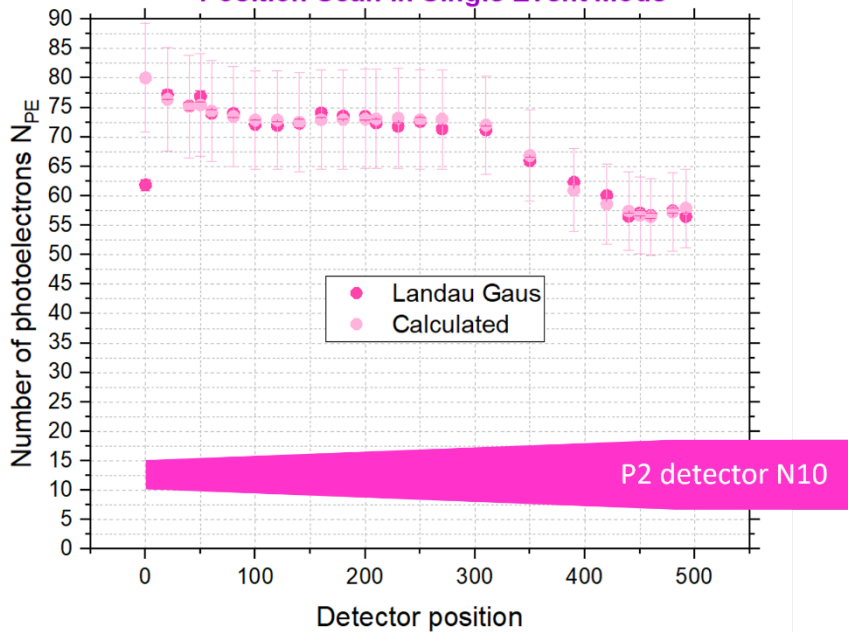

*3 DivA boards powered via daisy chain*

# Detector readout

## DAQ MODE: SEM

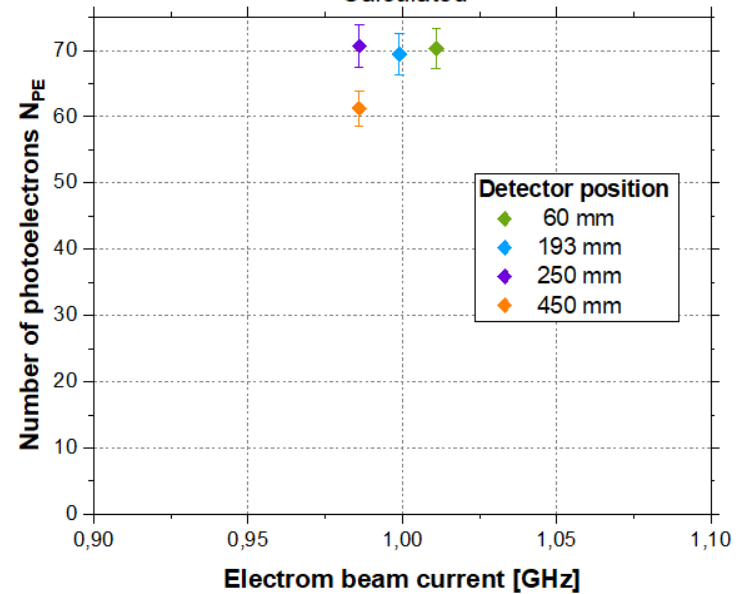

P2 detector N10  
Position Scan in Single Event Mode

ET923 + P2 detector (N10)  
SiO2 detector voltage = 790 V (nom. voltage)  
DAQ Trigger: Trigger scintillator  
Electron beam rate = 4 kHz @ scaler

## DAQ MODE: IM

Determined  $N_{PE}$  in Integration Mode  
*Calculated*

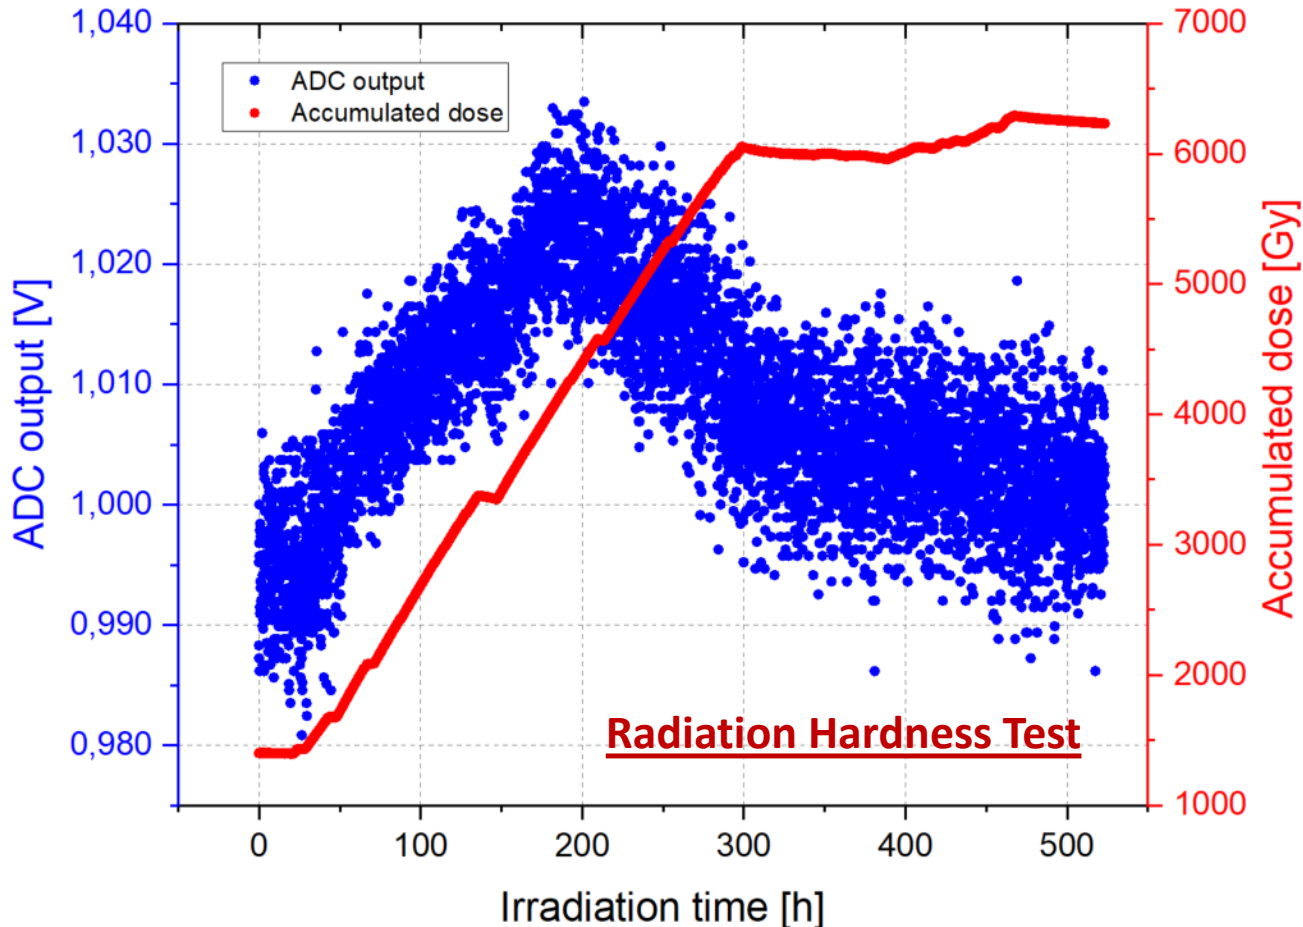

*Comparable determined number of photoelectrons  
in SEM (@4 kHz) and IM (@1 GHz)*

# Detector readout

Electronics exposed to radiation at A1

*Different voltage regulators are tested of radiation hardness  
→ results are coming soon*

# Single event mode: QDC

- QDC CAEN V965, 5 pieces delivered in September 2023, together with VME crate and CPU
- 80 readout channels in total
- First beam tests in August 2024

# Integrating mode: Sampling ADC

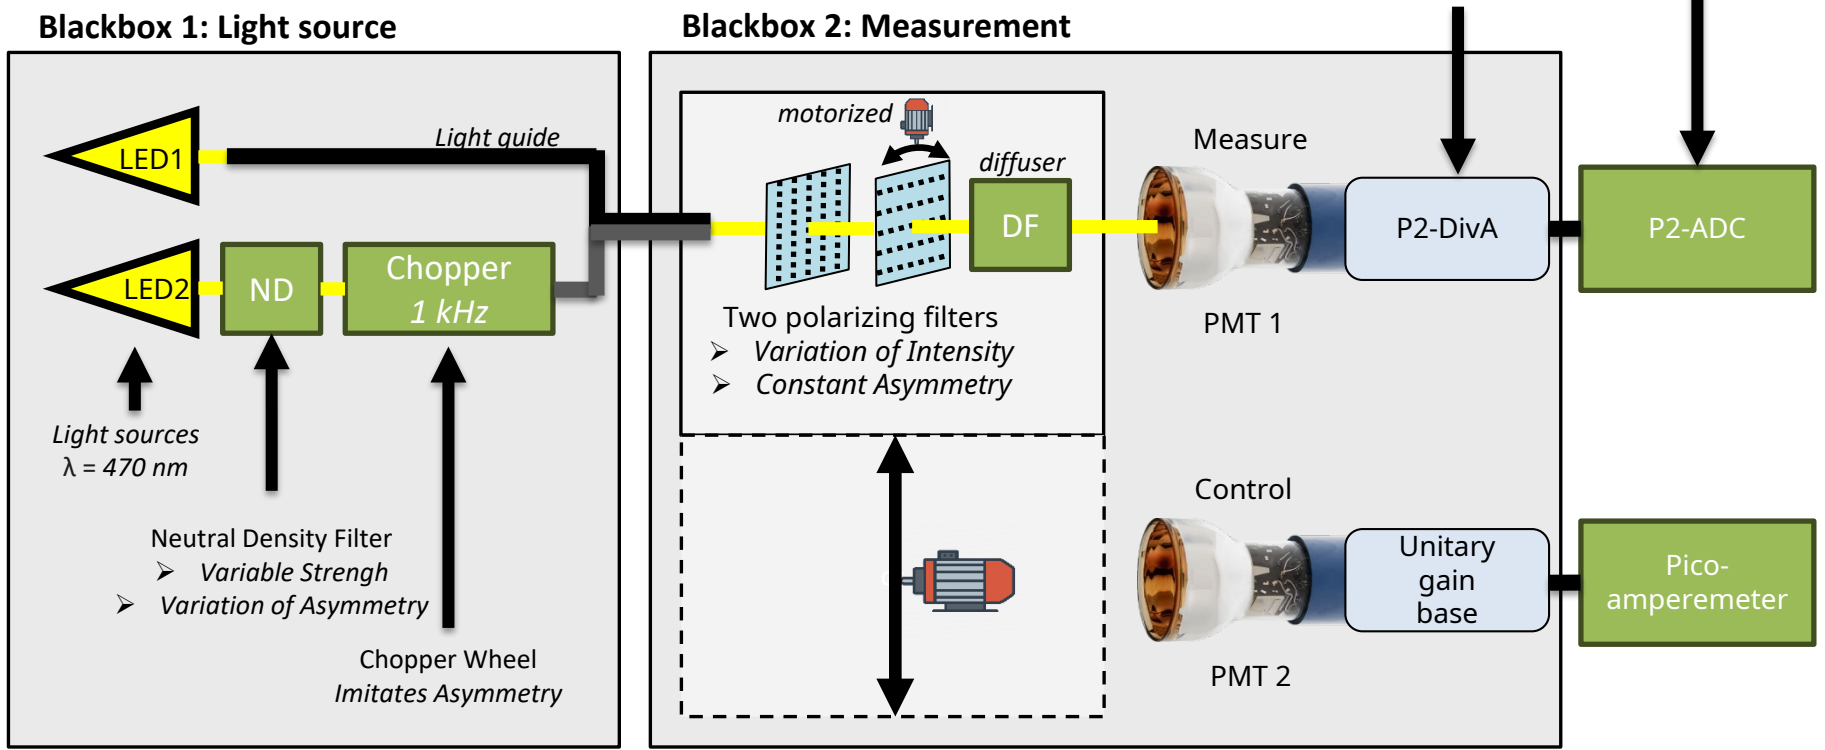

- Developed by U Manitoba/Triumf (MOLLER, P2)
- 16 channels per board
- 10 boards ordered, delivery until December 2024
- 10 FPGA (SoC Mercury+ XU1/Enclustra) already delivered

# Characterization of readout electronics – Integration mode

- Characterization of the **integration mode**
- Test the **P2-DivA** and the **P2 Analog-to-Digital converter (ADC)**
- LED setup produces an **asymmetric light signal**
  - **Mimic the parity violating asymmetry** of the P2 experiment
- Motorized polarizers for different light intensities
  - Keeping the asymmetry constant

# Characterization of readout electronics – Integration mode

Chopper wheel with LED mount

Measurement setup with a single PMT and P2-DivA Base

**Goal:**  
Tune (reduce) asymmetry produced by chopper setup to an order comparable to the P2-experiment

Measure asymmetry with P2-DivA and P2-ADC

Example for an exaggerated asymmetry measured by P2-ADC

Gate given by the reference output of the Chopper wheel controller

# Luminosity monitors

- Air Cherenkov detectors
- Møller electrons and small angle elastic scattering
- Placed 4.9 m behind the target

# Luminosity monitors

Two favourite designs under investigation

# Luminosity monitors

Design goals:

- Little light yield  
(*around 1 photoelectron per incident electron*)
- Little dependence of the yield on the beam position  
(*keep helicity correlated false asymmetries small*)

Beam test in August 2024

Analysis ongoing

# Computing

Delivered in November 2023:

6 servers for data processing, 1 server for data storage,  
1 multicore server for analysis, 5 NUKs for the counting room

- IT equipment for the counting room
- Online analysis
- Short term storage (100 Terabyte)

Not included here:

- Long term storage (1-2 Petabyte)
- Backup

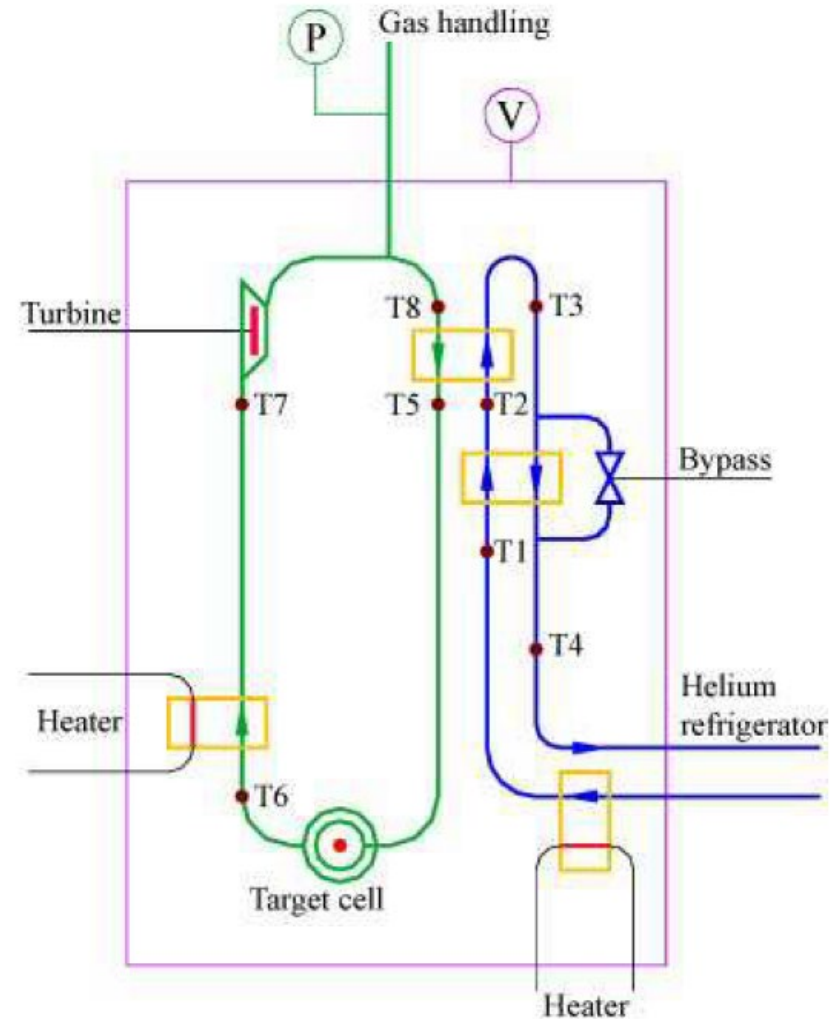

# Refrigerator

- Provides cold helium gas to cool the liquefied hydrogen target
- Design parameter:

<b>Cooling power</b>	<b>4.2 kW</b>
Inlet temperature	15 K
Inlet flow pressure	2.7 bar
Return temperature	19 K
Return flow pressure	1.2 bar

- Manufacturer: Linde Kryotechnik AG
- Compressors delivered: October 2023
- Cold box delivered: January 2024

# Refrigerator: Installation

**Compressor hall**

# Refrigerator: Installation

**Transfer**

# Refrigerator: Installation

# Liquid hydrogen target

## Target parameter

Pressure/Temperature	2.4 atm / 20 K
Cell Length	60 cm
$\dot{m}$ (mass flow)	< 2 kg/s
LH2 pump head	< 0.1 atm
Beam area on target	25 mm <sup>2</sup>
HX cooling power	4 kW
Target thickness	4.3 g/cm <sup>2</sup>
LH2 ( $\Delta\rho/\rho$ )	< 2%
LH2 ( $\delta\rho/\rho$ ) at 1 kHz	< 10 ppm

## Heat exchanger (HX)

## Target loop

# Liquid hydrogen target

- Cooperation with Silviu Covrig (Jlab), Jim Dunne (MSU) et al.
- Calculations and design exist
- Dedicated PhD thesis

# Hydrogen buffer

- 90 m<sup>3</sup> volume
- Pressure up to 3 bar
- Ordering in process

**This photo is for illustration purposes only**

# Status of the P2 forward tracker

Niklaus Berger

Institut für Kernphysik, Johannes-Gutenberg Universität Mainz

September 2024

# *P* $\sin^2 \theta_W$ The P2 Experiment

- High precision extraction of the weak mixing angle

$$A_{PV} = \frac{N_R - N_L}{N_R + N_L} = \frac{G_F Q^2}{4\sqrt{2}\pi\alpha} (Q_W - F(Q^2))$$

$$Q_W = 1 - 4 \sin^2 \theta_W$$

Need to know  $Q^2$ :

- Tracking detector in magnetic field
- Typically at lower rates
- Also important for systematics

*P2*  
sing<sub>w</sub>

# P2 Tracking detector

- Four double layers of HVMAPs
- Not covering the full azimuth:  
Two sectors in  $\phi$
- Built from flexprint/chip strips

## HV-MAPS requirements

- $\sim 2 \times 2$  cm, 80  $\mu\text{m}$  pixels, 70  $\mu\text{m}$  thin
- $< 300$  mW /  $\text{cm}^2$  power consumption
- LPGbT compatible output:  
160 MHz clock input, x4 PLL, 1.28 Gbit/s  
DDR output, 1 link per chip
- Wire-bond to flexprint
- Gated operation: Hit detection can be suppressed outside  $\sim 1$  ms gates without introducing extra noise  
(done successfully with two threshold mode in MuPix11, see figure)
- Surviving high instantaneous electron rate
- MuPix11 (Mu3e collaboration) does all this...

P2 production needs:

- 2700 working chips
- 155 wafers of 44 chips at 40% end-to-end yield

## Chip production issue

- The MuPix11 Fab (TSI) was bought by Bosch, change of production to SiC
- Barely enough MuPix chips for Mu3e...
- Moved to AMS-Osram (Austria), similar process
- Adapted chip design, included direct gate input
- Chip submitted, available ~ end of year/ early 2025
- Big interest in the community

am<sup>U</sup>

OSRAM

## Preparation for construction

- Built many mechanical and cooling prototypes
- Built a pick & place and glueing robot for automated assembly

## Outlook

- Preparing for module assembly
- Chips should become available in 2025
- Bottleneck likely testing of chips
  
- Need to procure gaseous helium cooling system, parts of DAQ hardware
- Ideally have first modules by end 2025

# Summary

- Many components already delivered
  - Others ordered, waiting for delivery
  - Few items: Ordering in process
- 
- Starting setup of the experiment after magnet commissioning
